

REMARKS

Based on the results of tests performed on the Metal Rust Guard (MRG) self-adhesive membrane, the following was concluded.

- The MRG membrane provides an excellent protective shield to the metallic surfaces that may be exposed to harsh and corrosive environments such as road salts, marine salt mist, airborne acid condensates and water containing corrosive contaminants.
- Test results have indicated that the MRG membrane was virtually impermeable to water vapor, which shows that the membrane can be used to wrap the products that are sensitive to moisture such as airborne humidity or direct exposure to water.
